

Remington 700 Adjustment Guide

1. Pull Weight adjustment –

The bottom front screw adjusts the pull weight. Turning this screw clockwise will increase the pull weight. Turning it counter clockwise will decrease the pull weight. If you only have digital clocks, just remember “righty tighty, lefty loosey”. Do not reduce pull weight below 1.5lbs (or 8oz for Calvin Elite Series.)

2. Overtravel

Make sure the weapon is clear and dry fire the trigger, while it is in the fired position

tighten the over travel screw in until it hits the trigger and then back it out about 1/6 of a turn or one flat

of the hex wrench.

It should move freely and fire easily but you shouldn't have to “chase” the trigger more than about .015
